

**Département : Maine-et-Loire (49)**
**Date : 1<sup>er</sup> août 2016**

Le BRGM – Service Géologique Régional des Pays de la Loire – gère depuis 2003 le réseau de suivi piézométrique patrimonial du département du Maine-et-Loire.

Depuis fin octobre 2014, ce réseau comporte 33 ouvrages répartis de manière à suivre les aquifères majeurs à l'échelle départementale et ceux, plus localisés, qui présentent un enjeu particulier (faluns du Miocène, calcaires du Bathonien-Jurassique).

Les données issues de ce réseau sont par ailleurs mises à disposition et téléchargeables sur le site internet public [www.ades.eaufrance.fr](http://www.ades.eaufrance.fr). ADES est la banque nationale d'Accès aux Données sur les Eaux Souterraines.

## Situation piézométrique au 1<sup>er</sup> août 2016

En juillet, après avoir tardé à se mettre en place, la vidange saisonnière des ressources en eau souterraine s'est affirmée. La baisse des niveaux piézométriques observés s'est déroulée à un rythme habituel pour la saison. Comme les années précédentes, les ouvrages de la Fontaine-Milon, Vernoiil, Vivy (nappe du Cénomaniens) et de Pontigné, Noyant, Vernoiil (nappe du Séno-Turonien) mettent en évidence une baisse des niveaux piézométrique accrue.

A début août, les niveaux piézométriques évoluent à la baisse et sont équivalents ou supérieurs aux niveaux moyens calculés (période 2004-2015).

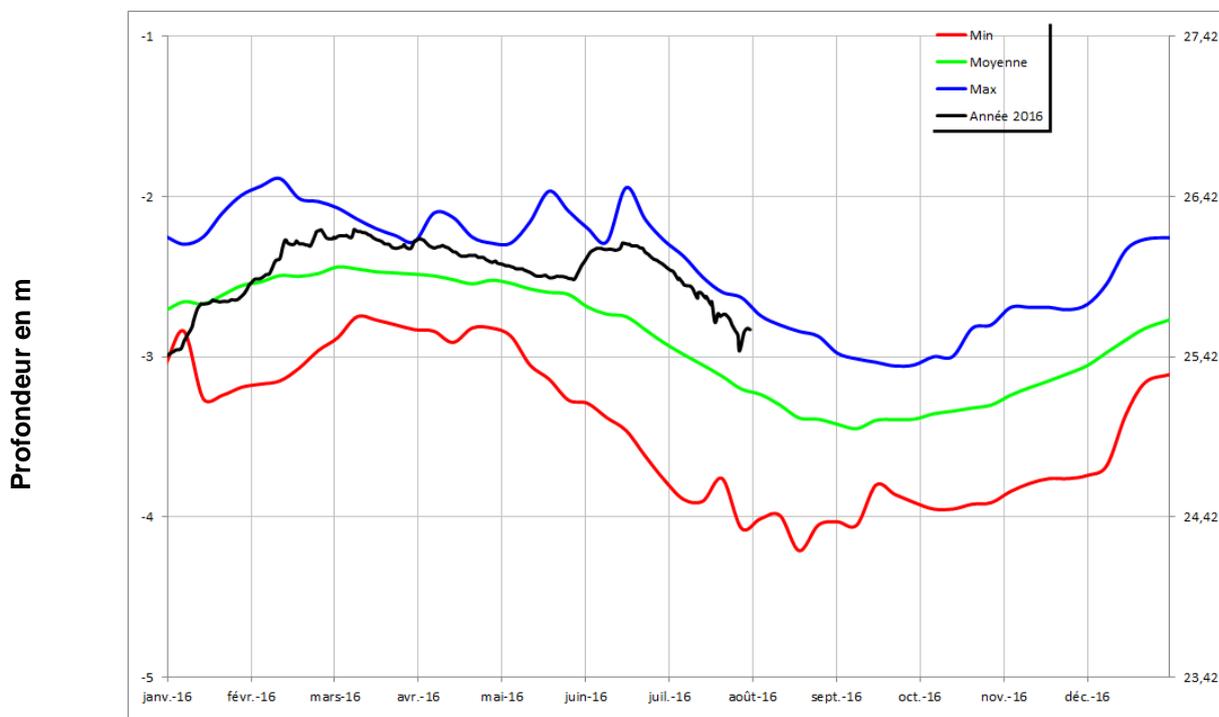

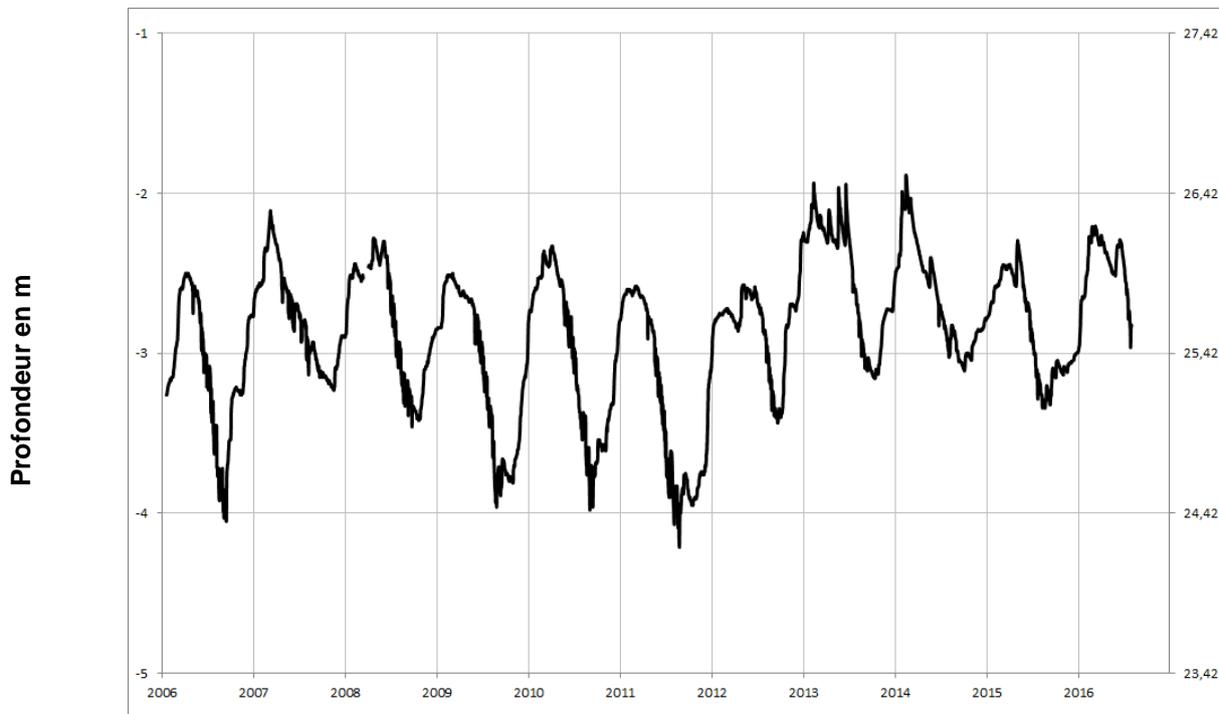

## Chroniques piézométriques au 1<sup>er</sup> août 2016

Seules les chroniques permettant d'illustrer la situation sont reportées.

L'ensemble des données de suivi de ce réseau est consultable et téléchargeable sur : [www.ades.eaufrance.fr](http://www.ades.eaufrance.fr).
